                                                                                                                                                                                                                                                                                             Hybridoma ATCC CRL 11627 was obtd. from a SJL/J mouse injected with spinal cord homogenate from a mammal uninfected with any demyedinating disease. The hybridoma produced a monoclonal antibody (SCH94.03) useful in promoting CNS remyelination. The SCH94.03 light chain amino acid sequence is given in AAR84553.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunosuppression; tissue transplantation; graft; L chain; V region; T-helper cell inhibition; transplant rejection; MAb; interleukin-2 receptor.
                                                                                                                                                                                Monoclonal antibodies which stimulate central nervous system re-myelination - are produced by hybridoma ATCC CRL 11627, for treating multiple sclerosis, and viral or post-neural diseases or

                                                                                                                                                                                                               The sequences given in AAR28670-71 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL.6R). The antibody which comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma PM1 which contained the plasmids pPM-K3 and pPM-h1. (Updated on 25-MAR-2003 to correct PN field.)

MAD MT 15.1 is deposited as clone 15-1/P3/14 (ECACC 9009705). The anti-CD4 antibody is used with at least one anti-IL2R alpha or beta antibody. Individually the antibodies are strongly inhibiting and when used together their immunosuppressive properties are improved; they synergistically inhibit T-helper cell proliferation to effectively inhibit transplant rejection at low doses without significantly reducing the general immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                       Antibody reactive with Fas ligand capable of inducing apoptosis - used for diagnostic assay of Fas ligand in body fluids and for treatment of diseases in which Fas ligand/Fas antigen is involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the light chain of the mouse anti-apoptosis inducing human Fas ligand, monoclonal antibody, 1919. The antibody can be used in a Fas ligand assay, e.g. an enzyme linked immunosorbant assay, to diagnose diseases in which the Fas ligand/Fas antigen system is implicated, e.g. hepatitis LG, human immunodeficiency virus, garaft/host disorders, ulcerative colitis or sequelae of myocardial infarction. The antibody may also be used to treat such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is used in the prodn. of a chimeric antibody mol. comprising two light chains and two heavy chains, each having a constant region (human) and a variable region (murine) having specificity to an antigen bound by murine monoclonal antibody (MAb) ME4. The chimeric antibodies can be used for any purpose for which the original murine MAbs can be used, with the advantage that they are more compatible with the human body. They are esp. used for the diagnosis and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MVSSAQFLGLLLLCFQGTRCDIQMTQTTSSLSASLGDRVTISCRASQDISSYLNWYQQKP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This represents the light chain of the mouse antibody F919-9-18. This is used for generating a mouse anti-human Fas ligand monoclonal antibody. The invention provides the use of Fas antagonist as an agent for the treatment and prevention of apoptosis-related diseases. The Fas antagonist can be a partial Fas antigen peptide containing the extracellular part of the protein, but lacking the signal sequence, an anti-Fas antibody, where the antibody is preferably a humanised antibody. The Fas antagonist is used in the treatment and prevention of diseases such as myocardial infarction, heart failure, ischemic heart disease, acute kidney failure, graft-versus-host disease, ischemic restenosis of the heart, liver or kidney, and endotoxic shock, and also as an organ preservative in transplantation. The agent is of low toxicity but effectively inhibits the Fas/Fas ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DGTIKLLIYYTSRLHSGVPSRFSGSGSGTDYSLTINNLEQEDIATYFCQQGNTLPYTFGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the light chain variable region of murine antibody ME4. The sequence was used to create chimeric mouse-human immunoglobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody ING-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytocoxicity to target cells. The chimeric antibodies can be used for therapeutic purposes in the

               Chimeric antibody; monoclonal antibody; ME4; antibody engineering; tumour; antigen; breast carcinoma; colon carcinoma; lung carcinoma; ovary carcinoma; melanoma; cancer; diagnosis; therapy; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric mouse-human antibodies - recognise a human tumour antigen, used for the treatment and diagnosis of human cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The light chain variable region (AAW06215) of mouse monoclonal antibody ME4 is the product of a CDNA clone (AAT43440) isolated from a ME4 hybridoma cDNA library. MAD ME4 (IgG1) binds to an antigen that is expressed on the surface of human lung, breast, colon and ovary carcinomas and melanomas, but not on most normal adult tissues. The light chain and heavy chain variable regions (see also AAW06216) of ME4 can be linked to human constant regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and expressed in transformed host cells. Novel mouse-human chineric antibodies (see also AAW06209-14 and AAW06217-18) can be produced that have specificity to human tumour antigens for use in the treatment and diagnosis of human cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention describes an antibody comprising a human constant region and a variable region having specificity for the human tumour antigen. Cobund by the ING-1 stationdy, where the ING-1 is produced by call line HB9912 as deposited with ATCC, and the antibody has the same affinity as the ING-1 for the human tumour antigen. The antibody is useful in an imaging method for detecting an antigen in a sample by contacting a label and relating the detected label to the presence of the antigen; for use in an imaging method for revealing the presence of a label-detectable containing the antigen; and for killing cells antigen in an animal by contacting the antibody with a part of the animal suspected of containing the antigen; and for killing cells callowing the killing to occur. The antibody and callowing the killing to occur. The antibodies are useful in tumour calls but do not bind detectably to normal cells, e.g., tibroblasts, endothelial cells on the chimeric antibodies against human cumour cells but do not bind detectably to normal cells, e.g., tibroblasts, endothelial cells or epithelial cells in the major organs. The high biological activity of the chimeric antibodies against human cumour cell lines combined with minimal reactivity with normal tissues imply that these antibodies may mediate selective destruction of capanate these antibodies may mediate selective destruction of capanate to clearance enhance the potential utility of these chimeric antibodies, and capanate continents and the body relative to the original murine mabs. This resistance to clearance enhances the potential utility of these chimeric antibodies, and therefore the amino acid sequence of a mouse antibody light chain the antibodies and in the creation of a muchine number them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibody for detecting antigen in animal or killing cells carrying antigen comprises human constant region and variable region having specificity for human tumor antigen bound by ING-i antibody
                                                                                                                                                                                                               Mouse; human tumour antigen; anti-human tumour antigen-antibody; ING-1 antibody; cell line HB9812; immunoassay; imaging; tumour diagnosis; tumour therapy; cytostatic; light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chang CP;

See AAR39266 for the heavy chain sequence. The antibody is specific for the GPIIa/IIIb protein and inhibits platelet agglutination. The Ig is thus useful in the treatment of thrombosis.

                                                                                   chain, used in the method of the invention involving the creation of a humanised in the method of the invention involving the creation of a humanised ig seapable of binding to GPID/IIIa and inhibiting platelet aggregation and also the releasing reaction of platelets. The Ig can be used for treating cardiovascular diseases and thromboembolic disorders, e.g. acute mycoardial infarction, unstable angina, stroke, transient ischemic episodes, deep vein thromboeis and pulmonary embolism, extraocrporeal cardiopulmonary circulation. The Ig can also be used in diagnosing the presence and location of a thrombus, or certain types of cancer cells which develop GPID/IIIa on their surfaces, for the detection of GPIIb/IIIa antigens or for isolating platelets.

The sequences given in AAR29010-11 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL-6R). The antibody which comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma AUK146-15 which contained the plasmids p146-k3 and p146-h1. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                  A monoclonal antibody which reacts only with the alphaV chain of human alphaV integrins; which blocks attachment of alphaV integrin bearing cells to integrin substrate; which reverses established cell matrix interactions caused by alphaV integrin; which blocks tumour development and which has no cytotoxic activity, may be used to treat tumours, especially melanoma (but also glioma, carcinoma) optionally coupled to a cytokine such as interleukin-2. The monoclonal antibody may also be used for diagnostic imaging of tumours and assesment of tumour growth when conjugated to a radio opaque-agent.

human Abs against HIV-1 comprising human Ig constant regions and
murine variable regions. These novel sequence are useful in
treatment, diagnosis and prophylaxis of HIV infections, and may be
produced by a bacterial, yeast or mammalian expression system.

                  monoclonal antibody (MAb), ICII, and is specific for an HIV-1
viral antigen. It is used in the construction of a chimeric
Mab comprising heavy and light chains having murine V regions
and human C regions. The chimeric Mabs are more effective than
murine MAb ICII since they have an increased compatibility in
humans. The heavy and light chain V-regions are joined by
manipulating their respective joining (J) regions, to generate
restriction enzyme recognition sites. The chimeric MAbs can be
used as immunoconjugates, in association with e.g. toxins for HIV
treatment. They can also be used in diagnosis of HIV.
